

McDonald's

EXECUTIVE SALES REPORT

Data Analytics Dashboard Summary
Prepared: May 2026 | Source: Order Details CSV + Menu Items XLSX | Tool: Power BI + Power Query

1. EXECUTIVE SUMMARY

This report presents key findings from McDonald's transactional sales data comprising 1,000 order line items across 201 unique orders. The data has been cleaned, enriched, and visualized using Microsoft Power Query and Power BI. Key metrics reveal evening-hour dominance, workday customer preference, and high-volume low-price items driving category totals.

1.1 Key Performance Indicators

KPI Metric	Value	Observation
Total Sales Revenue	\$205.00	Sample dataset — indicative of ordering patterns
Total Number of Orders	201	Unique customer transactions recorded
Total Quantity Sold	205 units	Slight >1 avg items per order
Average Order Value (AOV)	\$1.02	Reflects low-price side items in mix
Avg Order Value Per Day	\$2.47	Distributed across multiple calendar dates
Menu Items Available	32 items	Across 10 product categories
Data Completeness	99% valid	~1% null due to unmatched item IDs

2. TIME-OF-DAY REVENUE ANALYSIS

Orders were classified into four time bands using a custom Power Query M function applied to the order_time column. Revenue distribution reveals a strong concentration in post-noon hours.

Time Period	Hours	Avg Revenue	Performance
 Evening	5 PM – 9 PM	~\$13.00	★★★★★ Peak
 Afternoon	12 PM – 5 PM	~\$11.00	★★★★☆ High
 Morning	5 AM – 12 PM	~\$3.50	★★★☆☆ Low

 Night	9 PM – 5 AM	~\$1.50	★☆☆☆☆ Minimal
---	-------------	---------	---------------

Key Finding: Evening + Afternoon account for an estimated 85%+ of total daily revenue. Morning and Night sessions are significantly underperforming. This suggests opportunities for morning promotions or breakfast combo deals.

3. WORKDAY VS. WEEKEND PERFORMANCE

Each transaction was classified as 'workday' (Monday–Friday) or 'weekend' (Saturday–Sunday) using a conditional column in Power Query. The pie chart visualization confirms workday dominance.

Segment	Est. Share of Orders	Revenue Contribution
Workday (Mon–Fri)	~65%	Dominant
Weekend (Sat–Sun)	~35%	Secondary

Key Finding: Contrary to typical food-service patterns, workday traffic drives the majority of sales. This points to a strong lunch and after-work dinner customer base. Weekend promotions could be used to balance the demand curve.

4. PRODUCT & CATEGORY INSIGHTS

4.1 Top Performing Category: Sides

The Sides category — specifically Apple Slices (menu_item_id: 114, price: \$1.00) — emerges as a high-frequency purchase. Despite a \$1.00 unit price, Apple Slices accumulate \$25–\$30 in total sales, indicating extremely high order volume. This makes it the highest revenue item within the Sides category.

Item	Category	Unit Price	Est. Total Sales	Rank
Apple Slices	Sides	\$1.00	\$25–\$30	#1 Sides
Mozzarella Sticks	Sides	\$2.99	Moderate	#2 Sides
Big Mac	Burger	\$5.99	High	Top Burger
Angus Third Pounder	Burger	\$7.99	Moderate-High	Premium

4.2 Price Distribution Across Menu

The 32-item menu spans a price range of \$1.00 to \$7.99, with most items clustered between \$2.79 and \$6.99. Burgers represent the largest category (9 items) and the highest average price point. Sides and Fries are the lowest-priced categories but drive volume.

5. WEEKLY TREND OBSERVATIONS

The line chart in the dashboard tracks item-level prices over order dates, revealing two distinct patterns:

- 1. Higher-value line (~\$4–\$13): Increasing trend toward later dates — consistent with a premium item gaining repeat orders or seasonal promotional uplift.
- 2. Lower flat line (~\$2–\$3): Stable pricing from a consistent repeat item — likely a staple like a side or beverage with fixed demand.

Wednesday shows highlighted selection in the dashboard filter, suggesting it may be a focus day for analysis or a day with notable order volume spikes.

6. DATA QUALITY ASSESSMENT

Column	Valid %	Error %	Empty %	Notes
order_details_id	100%	0%	0%	Perfect primary key
order_id	100%	0%	0%	Clean order grouping
order_date	100%	0%	0%	Locale fix applied
item_id	99%	0%	1%	NULL strings cleaned
price (joined)	99%	0%	1%	Unmatched item_ids
Day Name / workday_type	100%	0%	0%	Derived columns clean

7. STRATEGIC RECOMMENDATIONS

#	Area	Recommendation
1	Evening Promotions	Launch 5 PM–9 PM combo deals to capitalize on peak traffic window

2	Morning Activation	Introduce breakfast bundle offers to lift the underperforming 5–12 AM slot
3	Weekend Strategy	Run weekend-specific loyalty rewards to convert workday-only customers
4	Sides Upsell	Bundle Apple Slices with burgers — it's already high-volume; pairing increases AOV
5	Data Quality	Investigate ~1% null item_id rows in source CSV to eliminate revenue leakage
